including at least one torsionally elastic damper including means for transmitting power between said at least one housing and said driven device, said power transmitting means comprising at least one energy storing element acting in a circumferential direction of said at least one impeller in a power flow between said at least one runner and said driven device and being spaced apart from and disposed radially outwardly of said axis, said power flow being effective when said at least one runner is connected with said rotary driven device.--.

Cancel the claim 25.

Claim 26, line 1, change "25" to --71--.

Cancel the claims 29 and 30.

Amend the claim 48 (AMENDED) as follows:

comprising a fluid coupling including at least one housing having an axis of rotation and connectable with a rotary driving device, at least one impeller disposed in and driven by said at least one housing when said housing is driven by said driving device, and at least one runner disposed in said at least one housing and connectable with a rotary driven device; a rotary output element connectable with said driven device; and damper means including at least two torsionally elastic dampers in a power train between said at least one housing and said

output element, each of said at least two dampers including at least one energy storing element acting in a circumferential direction of said at least one housing, the at least one energy storing element of one of said at least two dampers being disposed in a power [train] flow between said at least one runner and said output element and being spaced apart from and disposed radially outwardly of said axis, said power flow being effective when said a least one runner is connected with said rotary driven device, the at least one energy storing element of the other of said at least two dampers being disposed in a power train between said at least one housing and said a least one runner.--.

--71. (REPLACES THE ALLOWABLE CLAIM 25) Power comprising transmitting apparatus a fluid coupling including at least one housing having an axis of rotation and connectable with a rotary driving device, at least one impeller disposed in and driven by said at least one housing when said housing is driven by said driving device, and at least one runner disposed in said at least one housing and connectable with a rotary driven device; damper means including at least one torsionally elastic damper including means for transmitting power between said at least one housing and said driven device, said power

transmitting means comprising at least one energy storing element acting in a circumferential direction of said at least one impeller in a power flow between said at least one runner and said driven device and being spaced apart from and disposed radially outwardly of said axis; a bypass clutch in series with said at least one damper. (REPLACES THE ALLOWABLE CLAIM 29) --72. apparatus comprising a fluid coupling transmitting including at least one housing having an axis of rotation and connectable with a rotary driving device, at least one impeller disposed in and driven by said at least one housing when said housing is driven by said driving device, and at least one runner disposed in said at least one housing and connectable with a rotary driven device; damper means including at least one torsionally elastic damper including means for transmitting power between said at least one housing and said driven device, said power transmitting means comprising at least one energy storing element acting in a circumferential direction of said at least one impeller in a power flow between said at least one runner and said driven device and being spaced apart from and disposed radially outwardly of said axis; a bypass clutch in series with said damper means, said bypass clutch having a friction surface disposed at a first radial distance from said axis and said damper means
